Equilibrium of rigid bodies: Part 3

Two-force and three-force members:

Examples of Two-Force Members are shown in the figure.

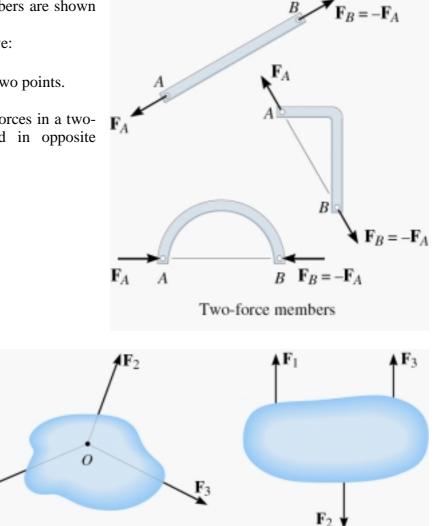

For two-force members we have:

- No couple moments,
- Forces applied only at two points.

Equilibrium requires that the forces in a twoforce member be equal and in opposite directions.

 \mathbf{F}_1

Concurrent forces (a)

Parallel forces

(b)

If member is subjected only to three forces, the forces should be either concurrent or parallel for member to be in equilibrium.
